

Can micro greens be produced using “Nonorganically produced, untreated seeds, or those that have been treated with a substance included on the National List of synthetic substances allowed for use in organic crop production,” according to §205.204.

First, micro greens should be produced using organic seed. Then, if organic seed is commercially unavailable for that variety of micro green, nonorganically produced, untreated seed may be used. In other words, follow the hierarchy of preference for organic seed according to the seeds and planting stock practice standard as defined in 205.204.
